

Hog office building, 18,213 m² (BDG2 public dataset)

[FREE SAMPLE](#)

Read from the 8,760 meter readings you sent, at 60-minute intervals, covering 100.0% of the period. Your file totals **1,219,929 kWh** — open it in Excel, sum the column, and you will get the same number.

ELECTRICITY USED WHILE THE BUILDING WAS CLOSED

649,635 kWh = 71,460 EUR

Across 6,250 hours outside 08:00–18:00 — **53% of everything the site bought**. While closed the building holds **71 kW** against 227 kW when occupied. Every 1 kW switched off out of hours is worth **688 EUR a year** at your own tariff.

THE DAY, HOUR BY HOUR

Median load at each time of day, working days against closed days. The shaded band is the lowest level your site has actually held while closed.

What the full review adds

- **Where to look first** — the specific schedule, calendar and circuit questions this profile raises, in the order a facilities team would work through them
- **What a reduction is worth** — your own figures converted into money at three levels of ambition
- **The worst days of the year**, dated, so a change can be trialled where it costs nothing to get wrong
- **Every measurement** with its formula printed beside it, plus the nine reconciliation checks the report is not issued without
- **An Excel workbook** that re-derives every headline number from your raw readings with ordinary spreadsheet formulas, so your own team can verify it without taking a word of it on trust

No site visit, no access to your systems. Reply and I will send the scope and the fee.

Prepared by Ali Mert Ozdemir from the interval data you supplied. Every figure on this page is a sum, a median or a product of your own readings — nothing is modelled, estimated or benchmarked. This is not an engineering survey and does not certify compliance with any standard.
