

EnergyLens

Smart energy for smart buildings

Pocket brief - live demo flow & talking points

metiundo · Energiewende konkret · 1 July 2026 · Berlin

What EnergyLens is, in one line

Estimation-first energy & compliance intelligence for building portfolios. It cuts energy cost and carbon and keeps a portfolio ahead of EU rules like EPBD - starting from the data a building already has (bills, meters, energy certificates), with no hardware required to begin.

Built & live

web platform, EU-hosted

No hardware to start

runs on bills + EPCs

Portfolio-first

compliance + funding case

The 30-second answer to "who are you / what do you do?"

"I'm an energy engineer, I just finished my M.Sc. here in Berlin, and I built EnergyLens on my own. It's an estimation-first energy and compliance layer for commercial and residential portfolios. You don't need sensors or smart meters to start - it runs on existing data like bills, meters and energy certificates, and gives you energy intensity, carbon, CRREM stranding risk, EPBD exposure, and ranked retrofit measures with subsidy-adjusted ROI. Every number is a range with its assumptions. It's built and live, and right now I'm talking to people in the field to see where it's most useful and where I can contribute."

Say this in THIS room (the bridge line)

The conference thesis is "smart-meter data = the gold that unlocks flexibility & revenue." Don't contradict it. Position one step before it:

"The way I see it: smart meters unlock the flexibility value you're all discussing today. My layer sits one step before that - it tells a portfolio owner which buildings to act on and how to fund it, from data they already have, for the whole Bestand that isn't metered yet. As the meters roll out, my layer just gets sharper. So I'm complementary to the metering side, not competing with it."

Honesty anchors (keep these exact)

Do you have customers / revenue?

"Built and live, lining up first pilots. Solo for now, incorporating as pilots land." Never invent customers or revenue.

How is this different from Green Fusion or an EMS?

"They optimise and control, with hardware. I'm the screening and decision layer before/around the hardware - EPBD, CRREM, the funding case - and it works for the whole stock that isn't metered yet."

Where does metiundo fit?

"Complementary. Metering unlocks flexibility value; my layer says which buildings to act on and how to fund it. As meters roll out, my layer gets sharper."

What data does it run on today?

"Existing bills, meters and EPCs; every figure shown as a range with its assumptions. The demo uses synthetic sample buildings - real pilots are the next step."

Show live, in this order

You are logged in on your phone. Open each page, say the one line, move on. Rule: show, don't narrate - 30 seconds each. If offline, the numbers below are your backup.

1 · Portfolio Overview

NO HARDWARE

2.14M kWh · avg EUI 296 · EUR 443K cost · 748 t CO₂ · 10 buildings, worst first.

Say: "This is day one - no sensors. Just the data a building already has."

2 · Compliance & Sustainability

NO HARDWARE

EPBD/MEPS · CRREM · EU Taxonomy · ESRS-E1. Here: 5 buildings strand by 2030, ESRS-E1 ready.

Say: "This is the cost of doing nothing - which buildings lose value, and when."

3 · Financing & Subsidies

NO HARDWARE

Indicative grant EUR 567K-1.1M across 24 measures · net capex EUR 1.6M after grant · portfolio NPV EUR 2.3-4M.

Say: "The funding case - BAFA/KfW-style subsidy capture, so the retrofit pays for itself."

4 · Recommendations (MACC)

NO HARDWARE

57 ranked measures · 33 no-regret · 1,524 t CO₂/yr abatable, sorted by cost per tonne.

Say: "What to do first - the cheapest carbon savings are on the left."

5 · Connections

THE BRIDGE

Wire up live sources: BACnet/IP and Modbus TCP meters & sensors, via an on-site edge agent.

Say: "When you're ready, connect hardware - this is where the platform starts taking live data."

6 · Live monitoring & battery

UNLOCKS WITH HARDWARE

Real-time power, HVAC delta-T efficiency, anomaly cost alerts, battery/solar dispatch ROI.

Say: "Add sensors and these pages light up. The more you connect, the more you unlock."

Optional - Copilot:

If there's time, ask it live: "Which buildings have the worst EUI?" or "Show the no-regret measures that pay for themselves."

The unlock ladder - why it drives more investment

Value on day one with zero hardware; every rung the customer adds opens new pages and analyses. That is the incentive to invest more.

Tier 0 · no hardware

Input: Bills + EPC

Unlocks: Portfolio, Compliance, Financing, MACC recommendations

Tier 1 · upload

Input: Meter/interval data upload

Unlocks: Sharper baselines, real consumption trends

Tier 2 · connect

Input: Meters & sensors (BACnet / Modbus / edge agent)

Unlocks: Live monitoring, HVAC efficiency, real-time anomaly alerts

Tier 3 · assets

Input: Battery / solar telemetry

Unlocks: Dispatch & flexibility ROI - the revenue story

"Start free of hardware, expand as it pays off. Each rung adds pages, so the platform grows with what the customer invests - and the flexibility revenue everyone here cares about lives at the top of the ladder."
